# 🚀 ECOM Development Guide for New Joiners

## 1. Access & Repository Setup
- Ensure you have the **necessary access** permissions before starting.
- Navigate to the Bitbucket repository:
  `https://bitbucket.dev.aws.singtel.com`
- In the search bar, select **ecom** → go into the respective module (e.g., `ecom_web`).

---

## 2. Branching Strategy
- The repository contains branches for different environments: **DEV, UAT, SIT, PROD**.
- For new development:
  - Search for the **SIT branch**.
  - Cut a new branch from SIT.
  - Clone the code locally.
  - Begin your development work in this new branch.

---

## 3. Build & Deployment
- Use **Bamboo** for build and deployment.
- Select the same module in Bamboo as in Bitbucket.
- Build the branch you created for coding.
- Deploy it to the target environment.

---

## 4. Handling Build Failures
- **Compilation Issues**
  - Check which file is causing the error.
  - If no recent changes are linked to the error, rerun the **ECOM EJB module**.
  - Wait for completion, then allow its child modules to auto-run.

---

## 5. Common Web Errors
- **Serial Version Mismatch Issue**
  - Cause: A mismatch in JAR versions between environments.
  - Resolution:
    - Rebuild the **ECOM EJB module**.
    - Rebuild its child modules.
    - Redeploy the updated build.

---

## 6. Quick Checklist for New Joiners

- ☑ Get access to Bitbucket & Bamboo.
- ☑ Clone SIT branch → create new branch.
- ☑ Develop and commit changes.
- ☑ Build & deploy via Bamboo.
- ☑ Troubleshoot build failures (compilation, EJB rerun).
- ☑ Resolve common errors (serial version mismatch).

---

This version is structured like a **mini playbook**: clear steps, causes, and resolutions. It’s concise enough for onboarding but detailed enough to guide troubleshooting.

Would you like me to also create a **visual workflow diagram** (like a step-by-step pipeline from Bitbucket → Branch → Bamboo → Deploy → Error Handling) so this guide looks more like a professional onboarding document?
