ecom -enterprise customer order management

📦 ECOM Order Flow

1. Order Submission
- Orders can be submitted either through the **UI** or via **Batch jobs**.
- Once submitted, the order triggers the **Order Broker**.

---

2. Order Broker
- The **Order Broker** processes and analyzes the order.
- Based on the type of order, it redirects to the appropriate system:
  - **ESOM** → Handles **non-mobile orders**.
  - **NCSOM** → Handles **mobile orders**.
  - **Kenan** → Billing fulfillment component (no provisioning required).

---

3. Fulfillment Process
- **Marker Configuration (OM Marker)** defines the fulfillment path.
- Activities are generated according to the marker configuration.
- An order is marked **complete** only when **all activities** are successfully generated and executed.

---

4. ECOM Post-Fulfillment
- Once an order is fulfilled:
  - A **JED (Job Execution Document)** is generated.
  - JED notifies **Kenan Billing** to update customer records.
- When the order is fully completed and closed:
  - Another notification is sent to **Kenan** to finalize billing updates.

🔑 Key Points
- **Order Broker** is the central routing engine.
- **ESOM/NCSOM** handle provisioning based on order type.
- **Kenan** ensures billing updates and fulfillment closure.
- **OM Marker** drives activity generation, which is critical for order completion.

- **JED** acts as the communication bridge between ECOM and Kenan.
